

Secure, Internet-based Transaction Interface

Easy, Intuitive User Account Management

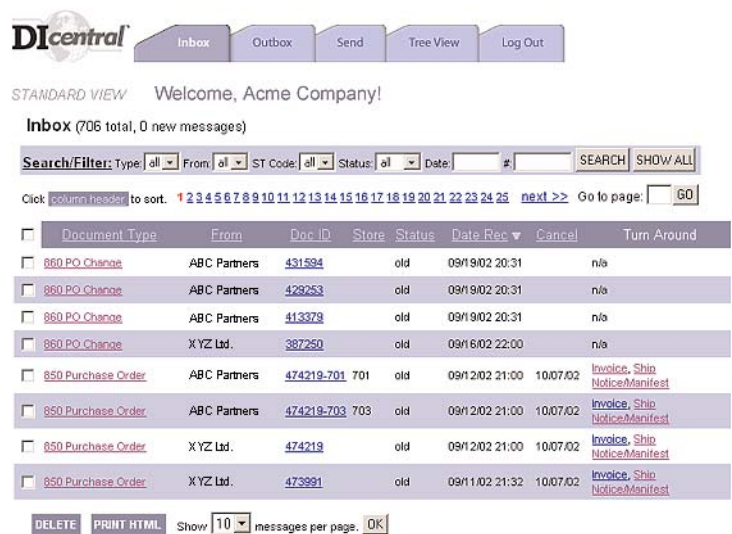

Whether for a small business or a global corporation, DIcentral provides full and secure access to your account using DIgateway, a Web-based transaction interface. DIgateway features the following navigational tools:

Send

- Used by small and mid-market companies to submit data to trading partners. Options include selecting a file upload or a unique document form that can be filled in with DIfiller™ before submitting directly to the selected trading partner.

Inbox

- View new inbound documents to line item detail. Usable by both large and small companies, either connected directly to DIcentral or when using DIfiller to post and view documents.
- Users can select to view their inbound data in either raw EDI format, Flat File or XML.
- Using the document turnaround feature, an inbound document can immediately be converted to an outbound document, with data fields prepopulated to correspond to the original document.
- Inbound document files may be saved to a local or network directory in EDI, ASCII or XML formats. See configuration folder for detailed import data configuration.

Outbox

- All outbound and sent documents are viewable at any time, whether the user is connected directly to DIcentral or using DIfiller to post and view documents.
- Read Receipt feature allows user to know if the recipient has acknowledged receipt of the sent document.
- With no re-keying of data, a user can easily resend a document.

Archive

- Inactive files may be stored in Archive folders, viewable at any time by the user.

User Configuration

- DIgateway has been designed for custom user configuration. For example, a user can configure, by both Business Partner and inbound document type, what data fields can be imported into their system and in what order.
