

Remote Control

Multi-level access to EDI Transaction Data

Remote Control is a set of customizable features designed to provide access and/or control of business documents to third parties in your organization. Remote Control allows for the sharing of electronic business documents, determined by an organization's business structure. Which scenario fits your company? DIcentral's Web-based EDI solutions for retail suppliers are revolutionizing the way retailers do business.

Scenario 1 - One sales manager, multiple sales people

A sales manager has a sales team of several people reporting to him. Using DIcentral's Remote Control system, the manager can see the entire sales team's EDI business documents at any time, and individual sales team members can see and modify their own document data. With Remote Control, a sales manager can manage a global sales team without leaving the office, giving each sales team member the tools to manage his or her accounts.

Scenario 2 - One supplier, multiple brokers

A supplier delivers food to several store chains, using different brokers who receive commissions for finding the store customers. With Remote Control, the supplier can see and modify all transaction data with his trading partners. Each broker only sees the data specific to their accounts.

Scenario 3 - One EDI office, multiple business personnel

With Remote Control, a company's EDI personnel can see and modify all transactions in their system. Their financial department can see all trading partner data and can monitor all transactions and reports for a particular day, week, month, or year. Remote Control empowers financial personnel to track transactions instantly with their trading partners and gives the EDI department the confidence of maintaining control of the data.

Scenario 4 - Multiple business units

An IT department for a national company processes E.D.I. data for all its business units. With Remote Control, the IT department can modify and view all the transactions, and the business units can monitor transactions relevant to them.
